Optimization Problems

- Solve applied minimum and maximum problems.

**Applied Minimum and Maximum Problems**

One of the most common applications of calculus involves the determination of minimum and maximum values. Consider how frequently you hear or read terms such as greatest profit, least cost, least time, greatest voltage, optimum size, least size, greatest strength, and greatest distance. Before outlining a general problem-solving strategy for such problems, let’s look at an example.

**EXAMPLE 1  Finding Maximum Volume**

A manufacturer wants to design an open box having a square base and a surface area of 108 square inches, as shown in Figure 3.53. What dimensions will produce a box with maximum volume?

**Solution**  Because the box has a square base, its volume is

\[ V = x^2h. \]

This equation is called the primary equation because it gives a formula for the quantity to be optimized. The surface area of the box is

\[ S = (\text{area of base}) + (\text{area of four sides}) \]

\[ S = x^2 + 4xh = 108. \]

Because \( V \) is to be maximized, you want to write \( V \) as a function of just one variable. To do this, you can solve the equation \( x^2 + 4xh = 108 \) for \( h \) in terms of \( x \) to obtain

\[ h = (108 - x^2)/(4x). \]

Substituting into the primary equation produces

\[ V = x^2h \]

\[ = x^2 \left( \frac{108 - x^2}{4x} \right) \]

\[ = 27x - \frac{x^3}{4}. \]

Before finding which \( x \)-value will yield a maximum value of \( V \), you should determine the feasible domain. That is, what values of \( x \) make sense in this problem? You know that \( V \geq 0 \). You also know that \( x \) must be nonnegative and that the area of the base \( (A = x^2) \) is at most 108. So, the feasible domain is

\[ 0 \leq x \leq \sqrt{108}. \]

To maximize \( V \), find the critical numbers of the volume function.

\[ \frac{dV}{dx} = 27 - \frac{3x^2}{4} = 0 \]

Set derivative equal to 0.

\[ 3x^2 = 108 \]

Simplify.

\[ x = \pm 6 \]

Critical numbers

So, the critical numbers are \( x = \pm 6 \). You do not need to consider \( x = -6 \) because it is outside the domain. Evaluating \( V \) at the critical number \( x = 6 \) and at the endpoints of the domain produces \( V(0) = 0, V(6) = 108 \), and \( V(\sqrt{108}) = 0 \). So, \( V \) is maximum when \( x = 6 \) and the dimensions of the box are \( 6 \times 6 \times 3 \) inches.
In Example 1, you should realize that there are infinitely many open boxes having 108 square inches of surface area. To begin solving the problem, you might ask yourself which basic shape would seem to yield a maximum volume. Should the box be tall, squat, or nearly cubical?

You might even try calculating a few volumes, as shown in Figure 3.54, to see if you can get a better feeling for what the optimum dimensions should be. Remember that you are not ready to begin solving a problem until you have clearly identified what the problem is.

Example 1 illustrates the following guidelines for solving applied minimum and maximum problems.

1. Identify all given quantities and quantities to be determined. If possible, make a sketch.

2. Write a primary equation for the quantity that is to be maximized or minimized. (A review of several useful formulas from geometry is presented inside the front cover.)

3. Reduce the primary equation to one having a single independent variable. This may involve the use of secondary equations relating the independent variables of the primary equation.

4. Determine the feasible domain of the primary equation. That is, determine the values for which the stated problem makes sense.

5. Determine the desired maximum or minimum value by the calculus techniques discussed in Sections 3.1 through 3.4.
EXAMPLE 2  Finding Minimum Distance

Which points on the graph of \( y = 4 - x^2 \) are closest to the point \((0, 2)\)?

**Solution**  Figure 3.55 shows that there are two points at a minimum distance from the point \((0, 2)\). The distance between the point \((0, 2)\) and a point \((x, y)\) on the graph of \( y = 4 - x^2 \) is given by

\[
d = \sqrt{(x - 0)^2 + (y - 2)^2}. \tag{Primary equation}
\]

Using the secondary equation \( y = 4 - x^2 \), you can rewrite the primary equation as

\[
d = \sqrt{x^2 + (4 - x^2 - 2)^2} = \sqrt{x^4 - 3x^2 + 4}. \tag{Secondary equation}
\]

Because \(d\) is smallest when the expression inside the radical is smallest, you need only find the critical numbers of \( f(x) = x^4 - 3x^2 + 4 \). Note that the domain of \( f \) is the entire real line. So, there are no endpoints of the domain to consider. Moreover, setting \( f'(x) \) equal to 0 yields

\[
f'(x) = 4x^3 - 6x = 2x(2x^2 - 3) = 0
\]

\[
x = 0, \sqrt{\frac{3}{2}}, -\sqrt{\frac{3}{2}}.
\]

The First Derivative Test verifies that \( x = 0 \) yields a relative maximum, whereas both \( x = \sqrt{\frac{3}{2}} \) and \( x = -\sqrt{\frac{3}{2}} \) yield a minimum distance. So, the closest points are \( (\sqrt{\frac{3}{2}}, \frac{5}{2}) \) and \( (-\sqrt{\frac{3}{2}}, \frac{5}{2}) \).

EXAMPLE 3  Finding Minimum Area

A rectangular page is to contain 24 square inches of print. The margins at the top and bottom of the page are to be 1 \(\frac{1}{2}\) inches, and the margins on the left and right are to be 1 inch (see Figure 3.56). What should the dimensions of the page be so that the least amount of paper is used?

**Solution**  Let \( A \) be the area to be minimized.

\[
A = (x + 3)(y + 2). \tag{Primary equation}
\]

The printed area inside the margins is given by

\[
24 = xy. \tag{Secondary equation}
\]

Solving this equation for \( y \) produces \( y = 24/x \). Substitution into the primary equation produces

\[
A = (x + 3)\left(\frac{24}{x} + 2\right) = 30 + 2x + \frac{72}{x}. \tag{Function of one variable}
\]

Because \( x \) must be positive, you are interested only in values of \( A \) for \( x > 0 \). To find the critical numbers, differentiate with respect to \( x \).

\[
\frac{dA}{dx} = 2 - \frac{72}{x^2} = 0 \implies x^2 = 36
\]

So, the critical numbers are \( x = \pm 6 \). You do not have to consider \( x = -6 \) because it is outside the domain. The First Derivative Test confirms that \( A \) is a minimum when \( x = 6 \). So, \( y = \frac{24}{6} = 4 \) and the dimensions of the page should be \( x + 3 = 9 \) inches by \( y + 2 = 6 \) inches.
EXAMPLE 4 Finding Minimum Length

Two posts, one 12 feet high and the other 28 feet high, stand 30 feet apart. They are to be stayed by two wires, attached to a single stake, running from ground level to the top of each post. Where should the stake be placed to use the least amount of wire?

Solution Let \( W \) be the wire length to be minimized. Using Figure 3.57, you can write

\[
W = y + z.
\]

Primary equation

In this problem, rather than solving for \( y \) in terms of \( z \) (or vice versa), you can solve for both \( y \) and \( z \) in terms of a third variable as shown in Figure 3.57. From the Pythagorean Theorem, you obtain

\[
x^2 + 12^2 = y^2
\]

\[
(30-x)^2 + 28^2 = z^2
\]

which implies that

\[
y = \sqrt{x^2 + 144}
\]

\[
z = \sqrt{x^2 - 60x + 1684}.
\]

So, \( W \) is given by

\[
W = y + z
\]

\[
= \sqrt{x^2 + 144} + \sqrt{x^2 - 60x + 1684}, \quad 0 \leq x \leq 30.
\]

Differentiating \( W \) with respect to \( x \) yields

\[
\frac{dW}{dx} = \frac{x}{\sqrt{x^2 + 144}} + \frac{x - 30}{\sqrt{x^2 - 60x + 1684}}
\]

By letting \( \frac{dW}{dx} = 0 \), you obtain

\[
x + \frac{x - 30}{\sqrt{x^2 - 60x + 1684}} = 0
\]

\[
x \sqrt{x^2 - 60x + 1684} = (30-x) \sqrt{x^2 + 144}
\]

\[
x^2(x^2 - 60x + 1684) = (30-x)^2(x^2 + 144)
\]

\[
x^4 - 60x^3 + 1684x^2 = x^4 - 60x^3 + 1044x^2 - 8640x + 129,600
\]

\[
640x^2 + 8640x - 129,600 = 0
\]

\[
320(x - 9)(2x + 45) = 0
\]

\[
x = 9, -22.5.
\]

Because \( x = -22.5 \) is not in the domain and

\[
W(0) \approx 53.04, \quad W(9) = 50, \quad \text{and} \quad W(30) \approx 60.31
\]

you can conclude that the wire should be staked at 9 feet from the 12-foot pole.

TECHNOLOGY From Example 4, you can see that applied optimization problems can involve a lot of algebra. If you have access to a graphing utility, you can confirm that \( x = 9 \) yields a minimum value of \( W \) by graphing

\[
W = \sqrt{x^2 + 144} + \sqrt{x^2 - 60x + 1684}
\]

as shown in Figure 3.58.
In each of the first four examples, the extreme value occurred at a critical number. Although this happens often, remember that an extreme value can also occur at an endpoint of an interval, as shown in Example 5.

**EXAMPLE 5  An Endpoint Maximum**

Four feet of wire is to be used to form a square and a circle. How much of the wire should be used for the square and how much should be used for the circle to enclose the maximum total area?

**Solution**  The total area (see Figure 3.59) is given by

\[ A = (\text{area of square}) + (\text{area of circle}) \]

\[ A = x^2 + \pi r^2. \]

Primary equation

Because the total length of wire is 4 feet, you obtain

\[ 4 = (\text{perimeter of square}) + (\text{circumference of circle}) \]

\[ 4 = 4x + 2\pi r. \]

So, \( r = 2(1 - x)/\pi, \) and by substituting into the primary equation you have

\[ A = x^2 + \frac{4(1 - x)^2}{\pi} \]

\[ = \frac{1}{\pi}[(\pi + 4)x^2 - 8x + 4]. \]

The feasible domain is \( 0 \leq x \leq 1 \) restricted by the square’s perimeter. Because

\[ \frac{dA}{dx} = \frac{2(\pi + 4)x - 8}{\pi} \]

the only critical number in \( (0, 1) \) is \( x = 4/(\pi + 4) \approx 0.56. \) So, using

\[ A(0) \approx 1.273, \quad A(0.56) \approx 0.56, \quad \text{and} \quad A(1) = 1 \]

you can conclude that the maximum area occurs when \( x = 0. \) That is, all the wire is used for the circle.

Let’s review the primary equations developed in the first five examples. As applications go, these five examples are fairly simple, and yet the resulting primary equations are quite complicated.

\[ V = 27x - \frac{x^3}{4} \]
\[ W = \sqrt{x^2 + 144} + \sqrt{x^2 - 60x + 1684} \]
\[ d = \sqrt{x^2 - 3x^2 + 4} \]
\[ A = \frac{1}{\pi}[(\pi + 4)x^2 - 8x + 4] \]
\[ A = 30 + 2x + \frac{72}{x} \]

You must expect that real-life applications often involve equations that are at least as complicated as these five. Remember that one of the main goals of this course is to learn to use calculus to analyze equations that initially seem formidable.
Exercises for Section 3.7

1. Numerical, Graphical, and Analytic Analysis Find two positive numbers whose sum is 110 and whose product is a maximum.
   (a) Analytically complete six rows of a table such as the one below. (The first two rows are shown.)
   
<table>
<thead>
<tr>
<th>First Number x</th>
<th>Second Number</th>
<th>Product P</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>110 - 10</td>
<td>10(110 - 10) = 1000</td>
</tr>
<tr>
<td>20</td>
<td>110 - 20</td>
<td>20(110 - 20) = 1800</td>
</tr>
</tbody>
</table>
   (b) Use a graphing utility to generate additional rows of the table. Use the table to estimate the solution. (Hint: Use the table feature of the graphing utility.)
   (c) Write the product $P$ as a function of $x$.
   (d) Use a graphing utility to graph the function in part (c) and estimate the solution from the graph.
   (e) Use calculus to find the critical number of the function in part (c). Then find the two numbers.

2. Numerical, Graphical, and Analytic Analysis An open box of maximum volume is to be made from a square piece of material, 24 inches on a side, by cutting equal squares from the corners and turning up the sides (see figure).

(a) Analytically complete six rows of a table such as the one below. (The first two rows are shown.) Use the table to guess the maximum volume.

<table>
<thead>
<tr>
<th>Height</th>
<th>Length and Width</th>
<th>Volume</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>24 - 2(1)</td>
<td>1(24 - 2(1))^2 = 484</td>
</tr>
<tr>
<td>2</td>
<td>24 - 2(2)</td>
<td>2(24 - 2(2))^2 = 800</td>
</tr>
</tbody>
</table>

(b) Write the volume $V$ as a function of $x$.
(c) Use calculus to find the critical number of the function in part (b) and find the maximum value.
(d) Use a graphing utility to graph the function in part (b) and verify the maximum volume from the graph.

In Exercises 3–8, find two positive numbers that satisfy the given requirements.

3. The sum is $S$ and the product is a maximum.
4. The product is 192 and the sum is a minimum.
5. The product is 192 and the sum of the first plus three times the second is a minimum.
6. The second number is the reciprocal of the first and the sum is a minimum.
7. The sum of the first and twice the second is 100 and the product is a maximum.
8. The sum of the first number squared and the second is 27 and the product is a maximum.

In Exercises 9 and 10, find the length and width of a rectangle that has the given perimeter and a maximum area.

9. Perimeter: 100 meters
10. Perimeter: $P$ units

In Exercises 11 and 12, find the length and width of a rectangle that has the given area and a minimum perimeter.

11. Area: 64 square feet
12. Area: $A$ square centimeters

In Exercises 13–16, find the point on the graph of the function that is closest to the given point.

13. $f(x) = \sqrt{x}$, Point: $(4, 0)$
14. $f(x) = \sqrt{x - 8}$, Point: $(2, 0)$
15. $f(x) = x^2$, Point: $(2, \frac{1}{4})$
16. $f(x) = (x + 1)^2$, Point: $(5, 3)$

17. Chemical Reaction In an autocatalytic chemical reaction, the product formed is a catalyst for the reaction. If $Q_0$ is the amount of the original substance and $x$ is the amount of catalyst formed, the rate of chemical reaction is

$$\frac{dQ}{dx} = k(x - Q_0).$$

For what value of $x$ will the rate of chemical reaction be greatest?

18. Traffic Control On a given day, the flow rate $F$ (cars per hour) on a congested roadway is

$$F = \frac{v}{22 + 0.02v^2}$$

where $v$ is the speed of the traffic in miles per hour. What speed will maximize the flow rate on the road?

19. Area A farmer plans to fence a rectangular pasture adjacent to a river. The pasture must contain 180,000 square meters in order to provide enough grass for the herd. What dimensions would require the least amount of fencing if no fencing is needed along the river?
20. **Maximum Area** A rancher has 200 feet of fencing with which to enclose two adjacent rectangular corrals (see figure). What dimensions should be used so that the enclosed area will be a maximum?

![Image of a rancher's fencing](image)

21. **Maximum Volume**

(a) Verify that each of the rectangular solids shown in the figure has a surface area of 150 square inches.

(b) Find the volume of each solid.

(c) Determine the dimensions of a rectangular solid (with a square base) of maximum volume if its surface area is 150 square inches.

![Image of rectangular solids](image)

22. **Maximum Volume** Determine the dimensions of a rectangular solid (with a square base) with maximum volume if its surface area is 337.5 square centimeters.

23. **Maximum Area** A Norman window is constructed by adjoining a semicircle to the top of an ordinary rectangular window (see figure). Find the dimensions of a Norman window of maximum area if the total perimeter is 16 feet.

![Image of a Norman window](image)

24. **Maximum Area** A rectangle is bounded by the x- and y-axes and the graph of \( y = (6 - x)/2 \) (see figure). What length and width should the rectangle have so that its area is a maximum?

![Image of a rectangle](image)

25. **Minimum Length** A right triangle is formed in the first quadrant by the x- and y-axes and a line through the point (1, 2) (see figure).

(a) Write the length \( L \) of the hypotenuse as a function of \( x \).

(b) Use a graphing utility to approximate \( x \) graphically such that the length of the hypotenuse is a minimum.

(c) Find the vertices of the triangle such that its area is a minimum.

![Image of a right triangle](image)

26. **Maximum Area** Find the area of the largest isosceles triangle that can be inscribed in a circle of radius 4 (see figure).

(a) Solve by writing the area as a function of \( h \).

(b) Solve by writing the area as a function of \( \alpha \).

(c) Identify the type of triangle of maximum area.

![Image of an isosceles triangle](image)

27. **Maximum Area** A rectangle is bounded by the x-axis and the semicircle \( y = \sqrt{25 - x^2} \) (see figure). What length and width should the rectangle have so that its area is a maximum?

![Image of a rectangle and a semicircle](image)

28. **Area** Find the dimensions of the largest rectangle that can be inscribed in a semicircle of radius \( r \) (see Exercise 27).

29. **Area** A rectangular page is to contain 30 square inches of print. The margins on each side are 1 inch. Find the dimensions of the page such that the least amount of paper is used.

30. **Area** A rectangular page is to contain 36 square inches of print. The margins on each side are to be \( \frac{1}{2} \) inch. Find the dimensions of the page such that the least amount of paper is used.
31. **Numerical, Graphical, and Analytic Analysis** An exercise room consists of a rectangle with a semicircle on each end. A 200-meter running track runs around the outside of the room.

(a) Draw a figure to represent the problem. Let \( x \) and \( y \) represent the length and width of the rectangle.

(b) Analytically complete six rows of a table such as the one below. (The first two rows are shown.) Use the table to guess the maximum area of the rectangular region.

<table>
<thead>
<tr>
<th>Length ( x )</th>
<th>Width ( y )</th>
<th>Area</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>( \frac{2}{\pi} (100 - 10) )</td>
<td>( (10) \frac{2}{\pi} (100 - 10) = 573 )</td>
</tr>
<tr>
<td>20</td>
<td>( \frac{2}{\pi} (100 - 20) )</td>
<td>( (20) \frac{2}{\pi} (100 - 20) = 1019 )</td>
</tr>
</tbody>
</table>

(c) Write the area \( A \) as a function of \( x \).

(d) Use calculus to find the critical number of the function in part (c) and find the maximum value.

(e) Use a graphing utility to graph the function in part (c) and verify the maximum area from the graph.

32. **Numerical, Graphical, and Analytic Analysis** A right circular cylinder is to be designed to hold 22 cubic inches of a soft drink (approximately 12 fluid ounces).

(a) Analytically complete six rows of a table such as the one below. (The first two rows are shown.)

<table>
<thead>
<tr>
<th>Radius ( r )</th>
<th>Height</th>
<th>Surface Area</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.2 ( \frac{22}{\pi (0.2)^2} )</td>
<td>( 2\pi (0.2) \left[ 0.2 + \frac{22}{\pi (0.2)^2} \right] = 220.3 )</td>
<td></td>
</tr>
<tr>
<td>0.4 ( \frac{22}{\pi (0.4)^2} )</td>
<td>( 2\pi (0.4) \left[ 0.4 + \frac{22}{\pi (0.4)^2} \right] = 111.0 )</td>
<td></td>
</tr>
</tbody>
</table>

(b) Use a graphing utility to generate additional rows of the table. Use the table to estimate the minimum surface area. (Hint: Use the table feature of the graphing utility.)

(c) Write the surface area \( S \) as a function of \( r \).

(d) Use a graphing utility to graph the function in part (c) and estimate the minimum surface area from the graph.

(e) Use calculus to find the critical number of the function in part (c) and find dimensions that will yield the minimum surface area.

33. **Maximum Volume** A rectangular package to be sent by a postal service can have a maximum combined length and girth (perimeter of a cross section) of 108 inches (see figure). Find the dimensions of the package of maximum volume that can be sent. (Assume the cross section is square.)

34. **Maximum Volume** Rework Exercise 33 for a cylindrical package. (The cross section is circular.)

35. **Maximum Volume** Find the volume of the largest right circular cone that can be inscribed in a sphere of radius \( r \).

36. **Maximum Volume** Find the volume of the largest right circular cylinder that can be inscribed in a sphere of radius \( r \).

**Writing About Concepts**

37. The perimeter of a rectangle is 20 feet. Of all possible dimensions, the maximum area is 25 square feet when its length and width are both 5 feet. Are there dimensions that yield a minimum area? Explain.

38. A shampoo bottle is a right circular cylinder. Because the surface area of the bottle does not change when it is squeezed, is it true that the volume remains the same? Explain.

39. **Minimum Surface Area** A solid is formed by adjoining two hemispheres to the ends of a right circular cylinder. The total volume of the solid is 12 cubic centimeters. Find the radius of the cylinder that produces the minimum surface area.

40. **Minimum Cost** An industrial tank of the shape described in Exercise 39 must have a volume of 3000 cubic feet. The hemispherical ends cost twice as much per square foot of surface area as the sides. Find the dimensions that will minimize cost.

41. **Minimum Area** The sum of the perimeters of an equilateral triangle and a square is 10. Find the dimensions of the triangle and the square that produce a minimum total area.

42. **Maximum Area** Twenty feet of wire is to be used to form two figures. In each of the following cases, how much wire should be used for each figure so that the total enclosed area is maximum?

(a) Equilateral triangle and square

(b) Square and regular pentagon

(c) Regular pentagon and regular hexagon

(d) Regular hexagon and circle

What can you conclude from this pattern? (Hint: The area of a regular polygon with \( n \) sides of length \( x \) is \( A = \frac{n}{4} \left[ \cot \left( \frac{\pi}{n} \right) \right] x^2 \).)

43. **Beam Strength** A wooden beam has a rectangular cross section of height \( h \) and width \( w \) (see figure on the next page). The strength \( S \) of the beam is directly proportional to the width and the square of the height. What are the dimensions of the strongest beam that can be cut from a round log of diameter 24 inches? (Hint: \( S = kh^2w \), where \( k \) is the proportionality constant.)
44. **Minimum Length** Two factories are located at the coordinates \((-x, 0)\) and \((x, 0)\) with their power supply located at \((0, h)\) (see figure). Find \(y\) such that the total length of power line from the power supply to the factories is a minimum.

45. **Projectile Range** The range \(R\) of a projectile fired with an initial velocity \(v_0\) at an angle \(\theta\) with the horizontal is
\[ R = \frac{v_0^2 \sin 2\theta}{g}, \]
where \(g\) is the acceleration due to gravity. Find the angle \(\theta\) such that the range is a maximum.

46. **Conjecture** Consider the functions \(f(x) = \frac{1}{2}x^2\) and \(g(x) = \frac{1}{2}x^2 - \frac{1}{2}x^2\) on the domain \([0, 4]\).

(a) Use a graphing utility to graph the functions on the specified domain.

(b) Write the vertical distance \(d\) between the functions as a function of \(x\) and use calculus to find the value of \(x\) for which \(d\) is maximum.

(c) Find the equations of the tangent lines to the graphs of \(f\) and \(g\) at the critical number found in part (b). Graph the tangent lines. What is the relationship between the lines?

(d) Make a conjecture about the relationship between tangent lines to the graphs of two functions at the value of \(x\) at which the vertical distance between the functions is greatest, and prove your conjecture.

47. **Illumination** A light source is located over the center of a circular table of diameter 4 feet (see figure). Find the height \(h\) of the light source such that the illumination \(I\) at the perimeter of the table is maximum if \(I = k \sin \theta / s^2\), where \(s\) is the slant height, \(\alpha\) is the angle at which the light strikes the table, and \(k\) is a constant.

48. **Illumination** The illumination from a light source is directly proportional to the strength of the source and inversely proportional to the square of the distance from the source. Two light sources of intensities \(I_1\) and \(I_2\) are \(d\) units apart. What point on the line segment joining the two sources has the least illumination?

49. **Minimum Time** A man is in a boat 2 miles from the nearest point on the coast. He is to go to a point \(Q\), located 3 miles down the coast and 1 mile inland (see figure). He can row at 2 miles per hour and walk at 4 miles per hour. Toward what point on the coast should he row in order to reach point \(Q\) in the least time?

![Figure 43](image1)

![Figure 44](image2)

50. **Minimum Time** Consider Exercise 49 if the point \(Q\) is on the shoreline rather than 1 mile inland.

(a) Write the travel time \(T\) as a function of \(\alpha\).

(b) Use the result of part (a) to find the minimum time to reach \(Q\).

(c) The man can row at \(v_1\) miles per hour and walk at \(v_2\) miles per hour. Write the time \(T\) as a function of \(\alpha\). Show that the critical number of \(T\) depends only on \(v_1\) and \(v_2\) and not the distances. Explain how this result would be more beneficial to the man than the result of Exercise 49.

(d) Describe how to apply the result of part (c) to minimizing the cost of constructing a power transmission cable that costs \(c_1\) dollars per mile under water and \(c_2\) dollars per mile over land.

51. **Minimum Time** The conditions are the same as in Exercise 49 except that the man can row at \(v_1\) miles per hour and walk at \(v_2\) miles per hour. Write the time \(T\) as a function of \(\alpha\). Show that the man will reach point \(Q\) in the least time when
\[ \frac{\sin \theta_1}{v_1} = \frac{\sin \theta_2}{v_2}. \]

52. **Minimum Time** When light waves, traveling in a transparent medium, strike the surface of a second transparent medium, they change direction. This change of direction is called **refraction** and is defined by the **Snell's Law of Refraction**, where \(\theta_1\) and \(\theta_2\) are the magnitudes of the angles shown in the figure and \(v_1\) and \(v_2\) are the velocities of light in the two media. Show that this problem is equivalent to that of Exercise 51, and that light waves traveling from \(P\) to \(Q\) follow the path of minimum time.
53. Sketch the graph of \( f(x) = 2 - 2 \sin x \) on the interval \([0, \pi/2]\).
   
   (a) Find the distance from the origin to the \( y \)-intercept and the distance from the origin to the \( x \)-intercept.
   
   (b) Write the distance \( d \) from the origin to a point on the graph of \( f \) as a function of \( x \). Use your graphing utility to graph \( d \) and find the minimum distance.
   
   (c) Use calculus and the zero or root feature of a graphing utility to find the value of \( x \) that minimizes the function \( d \) on the interval \([0, \pi/2]\). What is the minimum distance?

(Submitted by Tim Chapell, Penn Valley Community College, Kansas City, MO.)

54. Minimum Cost
   
   An offshore oil well is 2 kilometers off the coast. The refinery is 4 kilometers down the coast. Laying pipe in the ocean is twice as expensive as on land. What path should the pipe follow in order to minimize the cost?

55. Minimum Force
   
   A component is designed to slide a block of steel with weight \( W \) across a table and into a chute (see figure). The motion of the block is resisted by a frictional force proportional to its apparent weight. (Let \( k \) be the constant of proportionality.) Find the minimum force \( F \) needed to slide the block, and find the corresponding value of \( \theta \). (Hint: \( F \cos \theta \) is the force in the direction of motion, and \( F \sin \theta \) is the amount of force tending to lift the block. So, the apparent weight of the block is \( W - F \sin \theta \).)

56. Maximum Volume
   
   A sector with central angle \( \theta \) is cut from a circle of radius 12 inches (see figure), and the edges of the sector are brought together to form a cone. Find the magnitude of \( \theta \) such that the volume of the cone is a maximum.

57. Numerical, Graphical, and Analytic Analysis
   
   The cross sections of an irrigation canal are isosceles trapezoids of which three sides are 8 feet long (see figure). Determine the angle of elevation \( \theta \) of the sides such that the area of the cross section is a maximum by completing the following.
   
   (a) Analytically complete six rows of a table such as the one below. (The first two rows are shown.)

<table>
<thead>
<tr>
<th>Base 1</th>
<th>Base 2</th>
<th>Altitude</th>
<th>Area</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>8 + 16 cos 10°</td>
<td>8 sin 10°</td>
<td>≈ 22.1</td>
</tr>
<tr>
<td>8</td>
<td>8 + 16 cos 20°</td>
<td>8 sin 20°</td>
<td>≈ 42.5</td>
</tr>
</tbody>
</table>

(b) Use a graphing utility to generate additional rows of the table and estimate the maximum cross-sectional area. (Hint: Use the table feature of the graphing utility.)

(c) Write the cross-sectional area \( A \) as a function of \( \theta \).

(d) Use calculus to find the critical number of the function in part (c) and find the angle that will yield the maximum cross-sectional area.

(e) Use a graphing utility to graph the function in part (c) and verify the maximum cross-sectional area.

58. Maximum Profit
   
   Assume that the amount of money deposited in a bank is proportional to the square of the interest rate the bank pays on this money. Furthermore, the bank can reinvest this money at 12%. Find the interest rate the bank should pay to maximize profit. (Use the simple interest formula.)

59. Minimum Cost
   
   The ordering and transportation cost \( C \) of the components used in manufacturing a product is
   
   \[
   C = 100 \left( \frac{200}{x^2} + \frac{x}{x + 30} \right) \quad x \geq 1
   \]
   
   where \( C \) is measured in thousands of dollars and \( x \) is the order size in hundreds. Find the order size that minimizes the cost. (Hint: Use the root feature of a graphing utility.)

60. Diminishing Returns
   
   The profit \( P \) (in thousands of dollars) for a company spending an amount \( s \) (in thousands of dollars) on advertising is
   
   \[
   P = -\frac{1}{3} x^3 + 6x^2 + 400.
   \]

   (a) Find the amount of money the company should spend on advertising in order to yield a maximum profit.

   (b) The point of diminishing returns is the point at which the rate of growth of the profit function begins to decline. Find the point of diminishing returns.

Minimum Distance
   
   In Exercises 61–63, consider a fuel distribution center located at the origin of the rectangular coordinate system (units in miles; see figures on next page). The center supplies three factories with coordinates \((4, 1)\), \((5, 6)\), and \((10, 3)\). A trunk line will run from the distribution center along the line \( y = mx \), and feeder lines will run to the three factories. The objective is to find \( m \) such that the lengths of the feeder lines are minimized.
61. Minimize the sum of the squares of the lengths of vertical feeder lines given by
   \[ S_1 = (4m - 1)^2 + (5m - 6)^2 + (10m - 3)^2. \]
   Find the equation for the trunk line by this method and then determine the sum of the lengths of the feeder lines.

62. Minimize the sum of the absolute values of the lengths of vertical feeder lines given by
   \[ S_2 = |4m - 1| + |5m - 6| + |10m - 3|. \]
   Find the equation for the trunk line by this method and then determine the sum of the lengths of the feeder lines. (Hint: Use a graphing utility to graph the function \( S_2 \) and approximate the required critical number.)

63. Minimize the sum of the perpendicular distances (see Exercises 85–90 in Section P.2) from the trunk line to the factories given by
   \[ S_3 = \frac{|4m - 1|}{\sqrt{m^2 + 1}} + \frac{|5m - 6|}{\sqrt{m^2 + 1}} + \frac{|10m - 3|}{\sqrt{m^2 + 1}}. \]
   Find the equation for the trunk line by this method and then determine the sum of the lengths of the feeder lines. (Hint: Use a graphing utility to graph the function \( S_3 \) and approximate the required critical number.)

64. **Maximum Area** Consider a symmetric cross inscribed in a circle of radius \( r \) (see figure).
   (a) Write the area \( A \) of the cross as a function of \( x \) and find the value of \( x \) that maximizes the area.
   (b) Write the area \( A \) of the cross as a function of \( \theta \) and find the value of \( \theta \) that maximizes the area.
   (c) Show that the critical numbers of parts (a) and (b) yield the same maximum area. What is that area?

**Putnam Exam Challenge**

65. Find the maximum value of \( f(x) = x^3 - 3x \) on the set of all real numbers \( x \) satisfying \( x^4 + 36 \leq 13x^2 \). Explain your reasoning.

66. Find the minimum value of
   \[ \frac{(x + 1/x)^4 - (x^8 + 1/x^8) - 2}{(x + 1/x)^3 + (x^3 + 1/x^3)} \]
   for \( x > 0 \).

**Section Project: Connecticut River**

Whenever the Connecticut River reaches a level of 105 feet above sea level, two Northampton, Massachusetts flood control station operators begin a round-the-clock river watch. Every 2 hours, they check the height of the river, using a scale marked off in tenths of a foot, and record the data in a log book. In the spring of 1996, the flood watch lasted from April 4, when the river reached 105 feet and was rising at 0.2 foot per hour, until April 25, when the level subsided again to 105 feet. Between those dates, their log shows that the river rose and fell several times, at one point coming close to the 115-foot mark. If the river had reached 115 feet, the city would have closed down Mount Tom Road (Route 5, south of Northampton).

The graph below shows the rate of change of the level of the river during one portion of the flood watch. Use the graph to answer each question.

(a) On what date was the river rising most rapidly? How do you know?
(b) On what date was the river falling most rapidly? How do you know?
(c) There were two dates in a row on which the river rose, then fell, then rose again during the course of the day. On which days did this occur, and how do you know?
(d) At 1 minute past midnight, April 14, the river level was 111.0 feet. Estimate its height 24 hours later and 48 hours later. Explain how you made your estimates.
(e) The river crested at 114.4 feet. On what date do you think this occurred?

(Submitted by Mary Murphy, Smith College, Northampton, MA)
